All other milk replacers are designed for bucket feeding first and machines second.

from the air or can react to daily temperate changes. This will effect the flow rate and therefore the milk concentration. This can cause stress, scour, bloat and pneumonia.

Compumate® - ensures the powder in the hopper maintains a consistent flow rate.

Compumate® contains anti bacterial agents such as Lactoperoxidase, Lactoferrin and organic acids to ensure disease levels are minimised especially around the teat and feed station.

Bucket fed powders can contain ingredients that absorb moisture

Bucket fed calves do not use the same feeding teat or area.

Computerised machine fed calves are penned in large groups often of differing ages which encourages disease to multiply especially around the feeding area.

Compumate® contains high levels of Vitamin C, E and organic selenium to increase calf immunity

Bucket fed calves tend to be mixed in small groups of a similar age.

Computerised machine fed calves are penned in large groups of differing ages which encourages disease to multiply. Calves with weak immune systems increase the disease pressure on all other calves.

Compumate® is made with 4 vegetable oils to improve digestion and milk protein to increase bone and muscle growth.

Finally **Compumate®** contains both natural aromas and sweeteners to enhance intake and digestion.

Bucket fed calves eat more dry feed at a younger age.

Bucket fed calves have a feeding ceremony once or twice a day. Computerised calves do not so the flavour of the milk is vital

Compumate® needs to provide more growth for a longer period.

You bought a specialist machine insist on feeding a specialist powder
